Assistive Devices

You will need a **2 wheeled walker** (take to the hospital day of surgery) and a standard **cane**.

Incision Care

The surgical dressing (bandage) remains in place until removed in the office by Dr. Avino. The dressing may be reinforced with Tegaderm or island dressings to improve the seal or patch. Swelling, bruising, and mild redness around the dressing are normal. Call Dr. Avino's office at 561-727-1306 if the dressing becomes saturated or if you have any concerns.

Showers

Glad Press-N-Seal

Patients can shower after surgery with dressing/barrier applied over the incision. Dr. Avino recommends covering the dressing with clear plastic wrap to protect it from getting wet.

Physical Therapy

Home Health Care: First at Home (561) 963-8109

Home health care consists of home physical therapy and a nurse visit. During the first 2 weeks following your surgery, you will receive home physical therapy from the home healthcare agency. Outpatient physical therapy will begin after your first postoperative visit.

Outpatient Physical Therapy

You will be given orders for outpatient physical therapy. You should start outpatient therapy 1-2 days after you get home from the hospital and will need someone to drive you to and from therapy. You can go to the PT facility of your choice.

Driving

You can begin driving once you have regained adequate strength/control/coordination, are not taking any narcotic or opioid pain medications, and are walking without an assistance device.

This is typically 2-4 weeks following surgery.

Footwear

Dr. Avino recommends wearing tennis shoes only for the first 2 weeks after surgery.

Antibiotics and Dental

No dental visits for 90 days after surgery.

You will require antibiotics prior to dental visits for the first year after surgery.

What to Expect Following Surgery

Pain, swelling, warmth, and mild redness are normal following surgery. A small amount of blood or fluid on your bandage is normal. Contact us if you experience bleeding or drainage from your incision, persistent fever, or your medications are not controlling your pain. Seek immediate medical attention if you experience trouble breathing, shortness of breath, or chest pain.

Restrictions

No extreme ranges of motion (straddles, splits, yoga, etc.)
